The following product groups are available in Greenline:

- Geficell® flanking insulation strips
- Geficell® sheet overlays and underlays
- Gefidehn® expansion joint profiles
- various waterproofings

Looking to the future with the power of innovation!

In addition to our core focus on sound and moisture protection, we also manufacture bio-foam blocks for the packaging industry. These inlays, which are **fully recyclable**, are used, for instance, in tool cases!

What's our Mission?

Our mission is clearly defined! We strive to create a sustainable future in which buildings are protected in a high-quality and environmentally friendly way.

Our service promise is central to this:

We offer high-quality, climatefriendly sound and moisture protection for buildings

What is Bio-PE?

Discover our Bio-PE: an eco-friendly alternative to traditional PE, based on sugarcane. Bio-PE is produced using a by-product of food-grade sugar production—technical sugar, which does not compete with the food industry. Our Greenline approach helps to reduce the carbon footprint and supporting environmental protection. At the end of their lifecycle, Bio-PE products are 100 % recyclable and can be smoothly integrated into existing material streams.

The path to the Greenline product

How does the production process work?

The production of Bio-PE begins with the ecological cultivation of sugar cane with no harmful chemicals. After harvesting, the sugar juice is extracted and separated into two parts. Sugar juice A is used for sugar production, while

sugar juice B and the excess sugar crystals are used to produce **bioplastic**. Bio-PE can reduce the environmental impact of plastics, by closing the carbon cycle and reducing our dependence on non-renewable resources.
